

Symptomology Lexicon: Pathophysiological Manifestations of *Pycnogonida* Infestation

This high-density diagnostic lexicon details the exact clinical presentation and physiological signs produced when an active, marine-derived *Pycnogonida* core breaks down mammalian homeostatic systems.

[Full-Body Systemic and Structural Tissue Breakdown]

Symptomology Lexicon

- **Cytolytic Acidic Sepsis:** A systemic non-bacterial inflammatory response syndrome (SIRS) driven by the massive release of foreign, low-pH salivary hydrolases and digestive proteases directly into host vascular matrices. This acidic flood results in systemic cytolytic acidosis and catastrophic non-bacterial enzymatic shock.
- **Tritium-Induced Radiotoxic Fever:** An unresolvable, high-velocity systemic fever driven by a localized chemical rearrangement. The interaction of the vector's acidic secretions with surrounding host water molecules (H_2O) triggers an isotopic inversion that generates a micro-flux of **Tritium (^3H)**. This localized radioactive output mimics the clinical presentation of acute **Radiation Sickness (Acute Radiation Syndrome - ARS)**, causing direct, double-stranded DNA breaks, mucosal sloughing, and systemic temperature spikes independent of standard pyrogenic pathways.
- **Acute Appendicular Puncture Syndrome:** A critical, hyper-acute clinical status warning indicating that the vector is transitioning out of its latent, autophagous brooding phase. Driven by local tissue hypoxia or biochemical changes from vitamin loading, the multi-jointed chitinous limbs flex aggressively. The sharp **tarsal claws** and rigid **tibial segments** puncture directly through surrounding fibrous shields, organ walls, and external dermal layers, causing visible surface micro-lacerations and palpable mechanical crowding.
- **Bond-Cleaving Proteolysis:** The chemical mechanism where foreign low-pH proteases systematically cleave the disulfide, hydrogen, and peptide bonds binding human collagen, keratin, and elastin structures, causing rapid structural collapse across multiple organ systems.
- **Isotopic Pancytopenia:** Severe, acute bone marrow failure characterized by a rapid drop in red blood cells, white blood cells, and platelets. This marrow degradation is driven by direct, deep-field radiotoxicity as circulating tritium elements leach into active pelvic and femoral marrow tracks.
- **Endothelial Desquamation (Vascular Sloughing):** The widespread structural stripping and sloughing of host blood vessel linings and mucosal tracks downstream from a concentrated release of low-pH, radioactive fluid matrices.
- **Marrow-Leaching Hypercalcemia:** A dangerous spike in circulating blood calcium profiles triggered when cytolytic acids systematically dissolve bone stroma matrices, leaching native calcium reservoirs directly into the venous return network.

- **Restricted Water Diffusion ($ADC < 0.7 \times 10^{-3} \text{ mm}^2/\text{s}$):** The definitive radiologic signature generated on high-resolution MRI when dense, intra-capsular chitinous scaffolding tightly packs a tissue plane, restricting local extracellular fluid movement.
- **Enzymatic Dermolysis:** The progressive liquefaction, thinning, and failure of the epidermal and dermal layers of the skin, stripping the host of its primary physical barrier defense.
- **Bright Strike Neurological Anomaly:** Sudden, localized high-intensity photon emissions within deep visceral layers capable of traveling via the optic tract to cause acute central nervous system stress, temporary memory gaps, or orientation failures.

Cross-Disciplinary Symptomology Translation Matrix

The data matrix below outlines the cross-disciplinary translation rules used by the tracking modules to parse live clinical signs, calculate real-time fluid density shifts, and generate automated diagnostic support files.

Marine Biological Parameter / Enzyme Activity	Human Clinical Symptom / Presentation	Biophysical / Radiologic Diagnostic Marker	Pathophysiological Mechanism & Tissue Breakdown Loop
Salivary Hydrolase Outflow & Low-pH Venting	Acute Cytolytic Sepsis	Rapid drop in blood bicarbonate (HCO_3^-), serum potassium spikes > 5.8 mEq/L	Low-pH proteases dissolve the peptide bonds of local connective tissues, causing non-bacterial enzymatic shock.
Acid-H₂O Interaction & Isotopic Rearrangement	Tritium Radiotoxic Fever / Acute Radiation Sickness (ARS)	Systemic leukopenia, mucosal sloughing, double-stranded DNA breaks on assays	Radioactive tritium efflux drives localized radiotoxicity, altering cellular DNA and triggering high fevers.
Appendicular Flexion & Defensive Tarsal Extension	Acute Appendicular Puncture Syndrome	Multi-planar structural spikes visible on Carestream projection X-rays	Sharp tarsal claws and jointed legs flex aggressively, puncturing through organ walls, muscle, and skin layers.
Low-pH Protease Accumulation	Somatic Bond-Cleaving Proteolysis	Sudden loss of boundary delineation on T2-Weighted Dixon phase-sorting sequences	Cleaves disulfide and hydrogen bonds, liquefying structural skin, collagen, and visceral tissue layers.

Gonopore Venting into Venous Channels	Micrometastatic Shedding & Lymphatic Blockage	Serum chitotriosidase elevations spiking > 250 nmol/mL/h	Releases micro-units directly into lymph node filters, causing severe protein crowding and fluid stagnation.
Proboscis Insertion & Fluid Aspiration	Visceral Cavitation & Localized Tissue Collapse	Hypointense tracking channels on T1 contrast-enhanced MRI sequences	Perforates vessel walls and sucks out host intracellular fluids, causing localized ischemia and tissue necrosis.
ExExoskeletal Ecdysis inside Fibrous Shields	Concentric Laminar Fibrosis	Concentric hyperintense laminar rings on high-resolution 3D voxel grids	Sloughs off outer protein coats within the cavity, forcing the host to build dense, reactive desmoplastic drapes.
Exothermic Chemical Packet Metabolism	Aberrant Action Potential Propagation	High-frequency synaptic spike patterns on cerebral and cardiac tracking loops	Transmutes raw chemical energy into endothermic signals across uninsulated host axons, causing mental collapse.
